

BugBot Final – Main Board, root sheet
Connectors and mounting holes live here, not inside the modules.
Power and block-to-block links are drawn; peripheral nets join by label.

VSYS fans out to four sibling branches. The slide switch gates Q2 and Q3 together and carries only microamps. The 5 V boost taps UPSTREAM of both FETs, so Q3 still only ever carries motor current.

04 – Motor Drivers
4 x DRV8837 in IN/IN mode, one per motor.
All four nSLEEP share MOTOR_EN. The internal pulldown keeps every driver
asleep and its outputs high–Z until firmware raises it.
VM is the battery rail through Q3; VCC is 3V3 logic. Different pins.
